

Incense Movement

What we think – will manifest. It is never too late, let us follow this new path together.

Everything begins with the love for change and a plant of Iboza riparia.

When will you begin to stand up for a better and more just world?

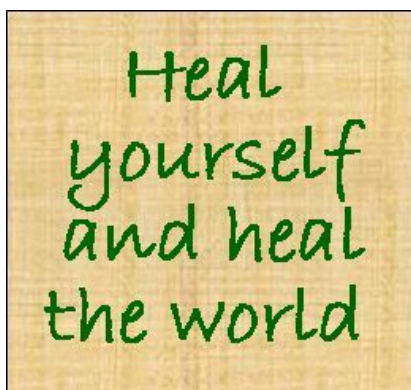

By taking care of an incense plant, you can let the facts speak!

Creating a new reality for our Earth, starting with your thoughts.

Only together we can change this world through love and positive thoughts.

The movement:

- has been created for our planet, humankind, the animals and the plants of this Earth.
- wants to stand up for the good and positive in this world, representing it and strengthening it.
- has the safeguarding and healing of our Mother Earth at heart.
- wants to support and promote the positive thought of humankind.
- because we see our Earth as a living being, protecting and supporting all living creatures.
- for those who feel the calling for a future worth living in which the planet, humankind, animals and plants live together in harmony.
- is open for anyone who wants to improve our world and allow it a future.
- does not oblige to anything, but is thankful for any kind of support.

Incense:

- an ancient natural remedy, integral part of magic and our religions – and the symbol of our movement.
- purifies its surroundings (room) from negative energies on a subtle level and reestablishes a positive space.
- creates clarity and enhances positive thoughts (smell).
- detoxes the body and helps in chronic cases.
- giving it as a present, brings joy and cultivating it, creates responsibility.
- fights the negative on our planet and supports the positive for a better future.

Participating in the movement is on a voluntary basis, non-binding and does not oblige to anything.

The only condition for being a part of the movement, is the possession and caring for a plant of Iboza riparia – alongside the will for positive thoughts in the name of our planet, humankind, the animal and plant worlds.

You can choose between two kinds of partnership.

The active partnership:

You are an active part of this movement.
You grow Iboza cuttings yourself and give them as a present to relatives, friends and acquaintances.
This leads to further partners for our movement.

The passive partnership:

You own and take care of an Iboza plant.
You are a part of the movement by applying positive thought and acting accordingly.

Iboza mother plant from an active partnership

Iboza-kindergarten (cuttings)

The offspring of Iboza plants lead to new partnerships.

New plant of Iboza for a partnership

Iboza, name of the genus taken from a Zulu language.

Family - Lamiaceae

Habitat - South Africa

Growth - perennial, partly upright, partly level or hanging downwards; soft young stems with tiny hairs, scalloped and lobed leaves with soft hairs smelling of rose and incense

Location - potted plant, rich soil, during summer in half shade in the garden

Flowering - July, August, September

Flower - long panicle of tiny purple flowers

Propagation - easily propagated from cuttings

Hardiness - not hardy, overwinter in a bright and mild surrounding

Animal visitors - due to the late flowering, pollination mainly by bumblebees

Care - cut back after flowering

Usable parts - plant used for scent and as incense

Compounds - geraniol

History and stories:

Surprisingly many plants emit a fragrance reminding that of roses, if touched. In the case of *Iboza riparia*, it is blended with a distinct resinous note which should be most appreciated by those who do not care too much for the sweet scent of roses.

Depending on the climate conditions, the rose scent varies in intensity and is sometimes hardly noticeable. In its original habitat, South Africa, *Iboza riparia* grows into a real shrub. That will not be the case here with us, unless a large, covered veranda is at hand.

The plant is easily kept in a pot of different sizes, during winter on a windowsill and in the summer outside. There, it grows up to a height of 1 meter, although it prefers a horizontal direction of growth or even lets the shoots hang down elegantly.

At the top of the shoots, during summer long panicles of small blue or lilac flowers grow.

After flowering, the shoots can be cut in order to allow the plant to grow stronger. It is also possible to cut the plant back in the fall before it is moved inside. The tips of shoots can easily be used to grow new plants if they lost their appearance over the winter.

They root easily in a glass of water or directly in sterile soil.
